1 DriveLock BitLocker Management

BitLocker Management offers you a number of advantages when compared to the standard usage of Microsoft BitLocker:

- Manage encryption with BitLocker technology from a central location
- Keep track of all client computers whose hard disks are encrypted with BitLocker
- Easily integrate native BitLocker environments in DriveLock BitLocker Management
- In addition to the common authentication methods, BitLocker Management also supports smartcard and token.
- Monitor the encryption and decryption states of individual client computers in the DriveLock Control Center
- BitLocker Management provides a secure and central administration of recovery keys
- Quickly decommission devices when they are lost or stolen in case they are re-connected to the network
- BitLocker Management prohibits unauthorized access to decommissioned or recycled devices
- DriveLock pre-boot authentication for BitLocker allows you to unlock the system partition using your Windows login. This eliminates the need to enter the computer-specific BitLocker password.

1.1 General information

1.1.1 System requirements

Note: For information on general system requirements (hardware and operating system requirements), see the latest Release Notes at DriveLock Online Help.

Warning: In some cases, it may be necessary to prepare the hard disk with the boot partition prior to using it with BitLocker. In this case, please perform the following steps:
 Check the status using "manage-bde -status c:"
 If the following error message pops up, "ERROR: The volume C: could not be opened by BitLocker. This may be because the volume does not exist, or because it is not a valid BitLocker volume." make sure to prepare the hard disk.
 See https://docs.microsoft.com/de-de/windows-server/administration/windows-commands/bdehdcfg. In an admin command line, you can prepare it by using "bdehdcfg.exe -target default" or "bdehdcfg.exe -target default -restart -quiet" (without prompting for scripting)

DriveLock BitLocker Management supports the following operating systems:

- Windows 7
 - Starting with Windows 7 SP1 (version 6.1.7601)
 - only 64 bit operating system
 - only Ultimate and Enterprise Editions
 - an existing Trusted Platform Module (TPM chip or vTPM) is mandatory

• Windows 8

- starting with Windows 8.1, Update 1 (version 6.3.9600)
- 32 bit and 64 bit operating systems
- only Professional and Enterprise Editions
- no TPM required (recommended for security reasons)
- Windows 10
 - starting with Windows 10 1607 (version 10.0.14393)
 - 32 bit and 64 bit operating systems
 - only Professional, Enterprise and Education Editions
 - no TPM required (recommended for security reasons)

Warning: Please note that the BitLocker feature for server operating systems is not installed by default.

DriveLock PreBoot Authentication (DriveLock PBA) for Bitlocker only supports the following operating systems:

- Windows 10
 - UEFI firmware required
 - 64 bit operating systems
 - only Professional, Enterprise and Education Editions
 - no TPM required (recommended for security reasons)

1.1.2 Algorithms for DriveLock BitLocker Management

BitLocker Management uses the following algorithms that are based on the operating systems in use. The methods of the relevant previous versions are also supported. See System requirements.

Operating system	Algorithm
	• AES 128 bit with diffuser
	• AES 256 bit with diffuser
Windows 7	• AES 128 bit
	• AES 256 bit
	• AES 128 bit
Windows 8.1	• AES 256 bit
Windows 10	• AES XTS 128 bit
	• AES XTS 256 bit

Note: The default algorithm for data drives is AES 128 (this is the most compatible algorithm for almost all operating systems).

Note: Make sure to select the right algorithm. The above standard algorithms are the best choice in this case. When you integrate existing BitLocker environments, choosing the right one will affect how fast DriveLock can decrypt and re-encrypt the environment.

1.1.3 Licensing BitLocker Management

To license BitLocker Management, Please do the following::

- 1. Select the policy where you want to license BitLocker Management.
- 2. Select Global configuration, then Settings and then click License.
- 3. This opens the License Properties; go to the General tab.
- 4. Click **Add license file...** and follow the instructions.
- 5. Next, select your **license file**(BitLocker license).

6. In the following dialog, please specify how to activate your license file. We recommend online activation.

Mote: Make sure that you are connected to the Internet.

- 7. Finally, confirm that your license for BitLocker Management will be added to DriveLock Enterprise Service.
- 8. Confirm your settings in the final dialog to activate BitLocker Management.
- 9. Your license appears in the license properties on the **General** tab.
- 10. Next, open the **Licensed computers** tab. Select **All computers** on which you want to use BitLocker Management. You can also add individual computers, groups or organizational units by clicking **Add**.
- 11. Check the BitLocker Management box.

Warning: If you have already licensed Disk Protection (DriveLock FDE), BitLocker Management cannot be used in the same policy at the same time.

12. Apply your changes by clicking OK.

Note: If you have purchased the separate license for DriveLock PBA for BitLocker, you can also license it here. See also Licensing DriveLock PBA.

1.2 BitLocker policy configuration

1.2.1 Encryption settings

BitLocker Management allows you to manage the encryption of the client computers with BitLocker in your network from a central point.

Once you have licensed BitLocker Management, saved the policy and reopened it, you will see the new BitLocker Management sub-node in the **Encryption** node. Open the new sub-node to specify the settings for encryption, installation and authentication and to generate the encryption certificates.

Mote: If you are using BitLocker Management for the first time, start by creating the certificates.

1.2.1.1 Encryption certificates

To use BitLocker Management to encrypt hard drives, you first need encryption certificates. DriveLock requires these certificates for both encryption and recovery (to provide the recovery key and for a possible emergency logon).

DriveLock automatically adds the encryption certificates to the Windows Certificate Store where it also stores the passwords.

Note: It is absolutely necessary to store the encryption certificates in another secure location in the file system or on a smartcard.

BitLocker encryption certificates consist of two parts, the actual certificate (see figure below **DLBiDataRecovery.cer**) and the private key (see figure below **DLBiDataRecovery.pfx**):

🔄 DLBIDataRecovery.cer	04.12.2018	Security Certificate
DLBIDataRecovery.pfx	04.12.2018	Personal Information Exchange

The certificate for emergency logon consists of the following parts:

		-
🔄 DLBIEmergencyLogon.cer	04.12.2018	Security Certificate
DLBIEmergencyLogon.pfx	04.12.2018	Personal Information Exchange

Warning: Prevent these certificates from being overwritten, as they are required for the clients' system recovery.

When you create a new policy to use for controlling BitLocker Management (BitLocker policy), always generate new certificates first. Proceed as described in chapter Creating encryption certificates for BitLocker Management.

1.2.1.1.1 Create encryption certificates

Please do the following:

1. When you are finished creating the BitLocker policy and licensing BitLocker Management, save and reopen the policy. Then the BitLocker Management subnode appears in the policy tree.

Note: A text message indicates that no encryption certificates have been generated yet:

- 2. Click the **Encryption certificates** option or open the link in the text message.
- 3. In the Encryption certificate Properties dialog, select the **Generate certificates** button.

You can import any existing certificates by clicking the **Manage certificates** button. If you do so, make sure that you do not overwrite any existing certificates because otherwise recovery will be impossible.

4. Follow the wizard and specify a **certificate backup location**. This can either be a folder in the file system or a smart card.

- Note: Please make sure that the appropriate security requirements regarding storage location and access are met.
- 5. In the next step, define the passwords for the private keys (see figure).
 - Note: In this dialog, you specify the password for both the emergency logon certificate and the recovery certificate.

Encryption Certificate Crea	ation	×
Certificate protection Type the password to	protect the private keys for the certificate.	
Passwords are no need the passwor and recovery.	ne certificates are protected by passwords. It stored as part of the DriveLock policy. You will rds to access private keys for emergency logon e passwords in a secure location.	
Emergency logon certi	ificate password	
Password	•••••	
Confirm password	•••••	
Recovery certificate p	assword	
Password	•••••	
Confirm password	•••••	
	< Back Next > (Cancel

6. Next, DriveLock generates the encryption certificates in the location you specified.

1.2.1.2 User-related agent settings

When BitLocker Management or the DriveLock PBA for BitLocker is installed on a DriveLock agent, the users are informed by default and their client computer is restarted after 30 seconds after the installation. You can change these settings if necessary.

Agent settings tab

👹 User related agent settings		Not co	nfigured
Properties	?	×	hfigured hfigured
Agent settings Options			nfigured
 Display user information / confirm computer restarts Display notification area icon while configuring the computer intervention of the computer intervention of the computer is a second s			nfigured nfigured
Display user information before installing updates			
Automatically confirm all message boxes after	🚔 mir	nutes	
Behavior on restart Restart the system after Restart the system after 			
 Do not restart the computer (wait until manual restart) Run program after installation is finished Command line 			
Run as the currently logged-on user			
OK Cancel	A	pply	

On this tab you can decide whether notifications are displayed or not, and you can also choose when they appear in the notification area: during configuration, during encryption and/or before installing updates.

Select the **Do not restart computer (wait until manual restart)** option if you want to control it yourself. This allows you to start your own installation script, for example, with a shell command after the installation.

Two options are available:

- **Run as the currently logged on user**: The script runs with the rights of the user who is currently logged on. Normally it would run under the local system account.
- Run also after uninstall: The script runs during installation and uninstallation.

Options tab

Show BitLocker Management logon messages: Select this option if you want the preboot authentication information to appear in the notification area of the client computer after logon to Windows.

A message with detailed information will appear on the client computer (see figure):

1.2.1.3 Hard disk encryption settings

1.2.1.3.1 The General tab

On this tab you set the values for encryption and decryption with BitLocker.

Properties	?	,	×
General Encryption protection Recovery Execution option	ons		
Encrypt local hard disks on agent computers			
Encryption algorithm priority (topmost has highest priority)			
AES (256 bit key length) AES-XTS (256 bit key length) AES (128 bit key length) AES-XTS (128 bit key length) AES with Elephant diffuser (256 bit key length) AES with Elephant diffuser (128 bit key length) Hardware encryption		ove up ve dow	
Configure algorithm separately for each drive Settings			
Initial encryption			-
Display warning when disks are not fully encrypted			
Settings for native BitLocker			-
Manage native BitLocker environment Keep existing BitLocker algorithms Hide native BitLocker context menu entries			
OK Cancel		Apply	y

The following options are available:

- 1. Encrypt local hard disks on Agent computers:
 - Select this option to start the **encryption** of the hard disks with BitLocker. Before you do so, make sure that all other encryption settings (see below) are specified.

Warning: As soon as you check this option and the policy has been assigned and updated on the client, the encryption process starts.

• To allow **decryption** (see detailed description in chapter decryption), uncheck the option and, if necessary, specify a delay in days.

Warning: Once you uncheck the option and do not specify a delay (and the policy is assigned and synchronized by the client), the decryption process will start.

2. Encryption algorithm priority:

• The list of the different encryption methods is processed from top to bottom. Once BitLocker Management finds a suitable algorithm that can be applied to the client, it will use it for encryption.

Mote: We recommend placing the strongest algorithm at top level.

- You can also sort the algorithms manually according to your requirements.
- Hardware encryption algorithm:

This is a special algorithm some producers build in to their hard disks. If you want to use this algorithm, please move it to the top of the list.

• Example:

You may want to move the **AES with Elephant diffuser (128 or 256 bit key length)** entry up if you have many computers with Windows 7 systems to encrypt, so that this algorithm is preferred.

3. Configure algorithm separately for each drive:

• Select the required encryption algorithm for the system drive and the data drives by clicking the **Settings** button or choose 'Not encrypted' if no encryption is required.

Note: Please ensure that the drive letter and system partition assignment is the same for all computers this BitLocker policy is assigned to.

Encryption pe	r drive	×
Encryption sett	ings for each local drives	
Drive	Encryption	^
C:	AES (256 bit key length)	
💽 D:	AES (256 bit key length)	
💽 E:	Not encrypted	
💽 F:	Not encrypted	
💽 G:	Not encrypted	
💽 H:	Not encrypted	
🔍 💽 I:	Not encrypted	
J:	Not encrypted	
K:	Not encrypted	
💽 L:	Not encrypted	~
M·	Not encrypted	*
Change	ОК	Cancel

If you select the **Do not change encryption status** option, either the already existing algorithm will continue to be used or the drive will remain decrypted.

4. Initial encryption

• Encrypt only used disk space (fast initial encryption)

- Select this option if you want to encrypt only the used disk space.
- Background:

With Windows 8, BitLocker introduced a feature that the hard disk does not have to be fully encrypted, but only the part where data is stored. Encryption is much faster for this reason.

• Issue:

Data that has been deleted from the hard disk and that is no longer visible in the Explorer may actually still exist and the original data can be accessed with special tools.

Note: We recommend that you only enable this option if you want to encrypt new hard disks, for example. Make sure that there is no old sensitive data on the hard disk. Likewise, this option is recommended for all SSDs.

• Display warning when disks are not fully encrypted

Each time the system is rebooted or the DriveLock Agent is restarted, the system checks whether all hard disks are already fully encrypted according to the settings. If this is not the case, the user is notified accordingly.

5. Settings for native BitLocker

Manage native BitLocker environment

Select this option if you want to manage existing (native) BitLocker environments with DriveLock BitLocker Management. Please refer to chapter Integrating existing BitLocker environments for more information.

Keep existing BitLocker algorithms

Partitions that are already encrypted with BitLocker but do not match the algorithm defined in the policy retain the existing algorithm. Re-encryption is no longer necessary with this option. Re-encryption is no longer necessary with this option.

• Hide native BitLocker context menu entries

This option is enabled by default. It hides all BitLocker options in the Windows Start menu or in the Explorer so that the native BitLocker dialogs are not displayed. This limits the chance of accidentally encrypting a hard disk or a drive with BitLocker but without DriveLock.

1.2.1.3.2 The Encryption protection tab

1. Encrypt only if pre-boot logon succeeded at least once

This is a preventive measure that keeps encryption separate from the initial logon to the PBA. Encryption is delayed until the first logon is successful.

2. Response to configuration changes

• Delay decryption by [x] days:

This setting delays the decryption for the specified number of days. This may be useful so that the client computers and their users can be properly prepared for decryption.

Note: Once you select this option and assign the policy accordingly, a wizard opens on the client computers with native BitLocker-encrypted (and thus locked) data drives; this wizard prompts the user to take over the drives. This is where you must provide the passwords for the locked partitions before they can be taken over.

The default value is **3** days. This value provides additional protection against misconfiguration. If you want to perform decryption immediately, change the setting to 0 days.

• Do not decrypt:

This option is enabled by default. Its purpose is to prevent unintentional decryption of BitLocker encryption when the configuration is changed, for example, after DriveLock Agent updates, if group memberships are changed, or if the policy is no longer used by the DriveLock Agent.

Warning: Note that decryption is triggered only by disabling the **Encrypt local disks on agent computers** option described above. Decryption starts once the DriveLock Agent receives the configured policy with the mandatory decryption setting.

1.2.1.3.3 The Recovery tab

On this tab you specify where the encrypted recovery data should be stored. These are the settings you need when you start the recovery process.

Properties	?	\times
General Encryption protection Recovery Execution option	IS	
Recovery key rotation		
Maximum BitLocker recovery key age: 5 days		
Recovery Disk Keys will be stored on		
DriveLock Enterprise Service		
Server connections are configured under Global configurati Server connections	on	
◯ File server (UNC path)		_
O Local folder on agent computers (not recommended)		_
Login to File server (UNC path)		
User name		
Password		
Confirm password		
OK Cancel	A	pply

The following options are available:

Recovery key rotation

Use the **Maximum BitLocker recovery key age in days** setting to define the period for regular key rotation. This option ensures that the recovery key is replaced regularly. This prevents misuse of the recovery key. Here, the specification '1 day' refers to 24 hours. The recovery key is uploaded to DES immediately after the swap.

DriveLock Enterprise Service:

Select this option if you want to send the encrypted recovery data to the DriveLock Enterprise Service (DES).

File server (UNC path)

If you select this option, your encrypted recovery data is stored on a server, for example. When you select this option, you can specify a user name and password under the **Log in to file server** option.

Local folder on Agent computers (not recommended)

We recommend this option only if you store the key files on a secure storage medium (e.g. USB device) or move them to a secure location later.

1.2.1.3.4 The Execution options tab

You can select options for starting and delaying encryption, and for forced encryption on this tab.

You can configure whether BitLocker encryption on the DriveLock Agent should start depending on certain events, or whether the user can delay the encryption. The objective is to disturb the user as little as possible and to keep the computer performance constant without compromising the protection provided by the encryption.

The **Start enforced encryption after x hours** option is available only if you have selected BitLocker PBA in the Pre-boot authentication settings and specified a password. If the user has not assigned their own password by the time the specified time expires, encryption will be performed using the specified password. The counting starts the moment when the password dialog is displayed for the first time.

With the option **Start encryption only in the following events:** you can specify conditions when encryption may start. For example, if you want to specify that encryption should start only on a client computer if no users are logged in, check the option as illustrated in the figure below:

Note: When selecting the option when no application is running in full screen mode, make sure that the application is actually running in full screen mode and not just maximized. This option is particularly important when running CAD/CAM applications, for example.

In the lower section, you specify the maximum number of hours users are allowed to delay encryption. A value of up to 9000 hrs. is possible here. You also specify how long the delay notification is displayed to the user. Once this time has expired and the user has taken no action on their client computer, the encryption will start automatically. The same applies if no user is logged in.

Note: As soon as the user receives the delay notification, encryption will start and the protectors will be created automatically. Immediately after that, encryption is paused and then resumes once the user clicks Encrypt in the notification or the delay time expires (without user interaction). Then encryption continues. The system is already protected at that point, and the user must enter a password (or PIN in the case of TPM) when rebooting.

1.2.1.4 Pre-boot authentication settings

1.2.1.4.1 The Authentication type tab

Your choice of pre-boot authentication type (PBA) differs depending on whether the computers whose hard disks you want to encrypt contain a Trusted Platform Module (TPM) or not.

In the example below, the BitLocker pre-boot authentication is explicitly used. For information about DriveLock pre-boot authentication for BitLocker, refer to the corresponding chapter.

The following options are available on the Authentication type tab:

Properties					?	×
Appearance	Use	r synchronization	ers	User-wipe		
Emergency log	on	Self-wipe	ork pre	-boot (UEFI)		
Authentication	hentication type Password options Lo					
Pre-boot authentication type						
O No pre-boot au	thentica	tion				
BitLocker requires an active Trusted Platform Module (TPM) on all computers. Only the system partition will be encrypted, there is no additional authentication required to boot the computer.						
BitLocker pre-b						
The BitLocker password is required to boot the client computer. All users of this computer must use this password to log in. A recovery key is provided in case of emergencies.						
O DriveLock pre-boot authentication 🚫						
User authentication is required to boot the client computer. To authenticate the user, the user name and password or 2-factor authentication can be used. All emergency logon methods are available.						able.
The BitLocker PBA is used instead of the DriveLock PBA when there is a BIOS system in place and/or no DriveLock PBA license available.						
Global options						
 Automatically unlock all data partitions Mitigate TPM security to eliminate repeated entry of a recovery key (e.g. in connection with a docking station) 						
		ОК	Can	icel	A	oply

- 1. Select the first option No pre-boot authentication,
 - if there is a TPM built in on the hard disks you want to encrypt. In this case, an additional authentication when booting the computer is not required.

Mote: The protector DriveLock uses is called TPM only.

- Here, BitLocker accesses a TPM which has to be activated first in BIOS.
- If you chose this option, you can close the dialog and continue because you do not need to specify a password on the next tab.
- 2. Select the second option BitLocker pre-boot authentication (see figure),
 - if there is no TPM built in on the hard disks you want to encrypt or if you are not sure whether it is active.
 - In this case, DriveLock uses the original Windows BitLocker PBA.
 - Open the **Password options** tab to specify a password or to select one of the other options.

Note: The options on this tab are only available if you have selected BitLocker pre-boot authentication as the authentication type. The other tabs are inactive because the corresponding options refer exclusively to the DriveLock pre-boot authentication type.

- 3. In both cases, we recommend checking the **Automatically unlock all data partitions** check box. With this option set, both the system partition and all data partitions are unlocked after authentication on the computers you assign the BitLocker policy to.
 - Note: Unlike Microsoft, DriveLock unlocks the data partitions automatically for all users of a computer. The unlocking process by DriveLock BitLocker Management works independently of the Windows Bitlocker functionality; this means, for example, that the call manage-bde -status still returns "Automatic Unlock: Disabled" for drives that DriveLock unlocks.
- 4. The Mitigate TPM security ... option can be used to customize the TPM platform validation. The option is useful, for example, when BitLocker-encrypted laptops keep requesting the recovery key as soon as the laptop is not connected to the docking station. The new option affects any pre-boot authentication type, as DriveLock uses TPMbased protection mechanisms as soon as TPM is available (TPM only, TPM/PIN, TPM/StartupKey). The option is disabled by default.

1.2.1.4.2 The Password options tab

There are different options available:

Properties					?	×	
Appearance	User synchronization Users					-wipe	
Emergency logo	on	-boot (U	EFI)				
Authentication t	ation type Password options Logon methods						
Valid for: 🚦 BitLocker pre-boot authentication							
Predefined BitLocker password:							
Password							
Confirm							
User cannot	change	password					
User must ch	nange pa	assword at first enc	ryption				
Maximum pa:	ssword a	age: 0 🚔	days				
🛕 The user m	ust ente	r a password befor	e the encr	yption	will start.		
-							
Back up user related recovery information							
Password must meet the following requirements:							
Allow only numbers							
Allow numbers and Latin based characters							
Minimum password length 8 🚔 characters							
A valid passv	vord mus	st contain at least					
1 el lower case letters 1 el numbers							
1 i upper case letters 1 i special characters							
Treat numbers as special characters							
		ОК	Can	cel	Δ	vlaa	
		UN	Can	CCI		φρiλ.	

- 1. You specify a **BitLocker password** and select none of the other options in the in the top part of the dialog:
 - The encryption process starts when you activate it and/or assign the policy. The user of the client computer is allowed to change the password later or continues to use the password you specified.

Note: Please note that you are responsible for communicating the password to the users over a secure channel.

- 2. You check the User cannot change password box:
 - Please specify a fixed password which the user can never change. The initial encryption process starts automatically even without the user being

logged on to the client computer, after you activate it and/or assign the policy.

• As soon as the user starts the computer, the BitLocker password must be entered to unlock the encrypted hard disks.

Note: Please provide users with the appropriate password information over a secure channel.

- The password is entered independently of the encryption progress, i.e. as soon as encryption is started, the BitLocker password must be entered in the PBA.
- 3. You check the option **User must change password at first encryption** (see figure):
 - The user can specify a password, you do not enter a password here.
 - If required, you can define the requirements the user password must meet.
 - The encryption process starts as soon as the user specifies the password.
 - The password may be changed later.
 - With the **Maximum password age** setting, you specify the number of days after which the end user must change the password again.

The options below **Password must meet the following requirements:** provide precise criteria that a password assigned by the user must meet. The option is selected by default.

1. You can select the **Allow numbers only** option if all client computers are equipped with a TPM which means that 6 characters are allowed.

Warning: If there is no TPM on client computers or non-system partitions need to be encrypted as well, the default is still at least 8 characters. (Microsoft default for passwords on data partitions).

- The Allow numbers and Latin based characters option restricts the usage of allowed characters. Special characters can no longer be used with this setting. Please note the information in the BitLocker pre-boot authentication chapter.
- 3. With the **A valid password must contain at least...** options you define the number of letters, numbers and special characters:

- The password may be between 8 and 20 characters long. A number below 8 or higher than 20 leads to an error message.
- Define the minimum requirements (number of letters, number, special characters etc.).
- If you select the **Treat numbers as special characters** option, numbers count as numbers and also as special characters. Please make sure that the numbers and special characters correspond.

1.2.1.5 Allow local PBA configuration changes

You can use the 'dlsetpb.exe' command line tool to modify the PBA configuration on a computer. This setting determines whether these configuration changes are maintained or overwritten (with the settings from the policy, e.g. which keyboard driver to use) the next time the policy is updated. By default, the changes from the command line tool are kept.

Note: When updating from a version prior to 2020.2, all settings are treated as if they were set by the command line tool.

1.2.1.6 Select PBA keyboard driver

This setting allows you to specify the keyboard driver for the PBA.

For example, if the default driver you are using does not recognize different keyboard layouts, you can select a driver from DriveLock here. The combi driver combines both keyboard and mouse drivers in one. If this doesn't lead to the result you want, you can also use the (older) DriveLock keyboard driver.

Mote: You may need to set different drivers on different devices.

1.2.1.7 Load SmartCard drivers in PBA

Use this setting to specify whether you want to enable the DriveLock SmartCard driver. If you want to use SmartCards and the default driver does not recognize them, you can use this setting.

Note: Note that you may need to set different SmartCard drivers on different devices.

1.2.2 Decryption

Decryption is triggered with a single setting that is specified in the **Harddisk encryption** settings on the **General** tab.

You can monitor the decryption process (same as the encryption process) in the DriveLock Operations Center (DOC).

The Event report (BitLocker events) also provides information on the decryption/encryption of individual computers.

1.2.2.1 Decrypting encrypted drives

To start decrypting encrypted drives, proceed as follows:

- 1. Open the respective BitLocker policy.
- 2. Open the General tab in the Harddisk encryption settings dialog.
- 3. Uncheck the Encrypt local hard disks on Agent computers option.

Properties	?	\times				
General Recovery						
Encrypt local hard disks on agent computers						
Encryption algorithm priority (topmost has highest priority)						
AES (256 bit key length) AES-XTS (256 bit key length) AES (128 bit key length) AES-XTS (128 bit key length)	Move Move o					
Configure encryption settings per drive Settings						
Initial encryption						
Encrypt only used disk space (fast initial encryption) Display warning when disks are not fully encrypted						
Settings for native BitLocker						
Manage native BitLocker environment Hide native BitLocker context menu entries						
Installation protection						
Encrypt only if pre-boot login succeeded at least once						
 Response to configuration changes Delay decryption by 3 + days Do not decrypt 						
OK Cancel	Ap	ply				

4. Set a value for the **Delay decryption by** *x* days setting. The default value is **3**, which means that decryption starts after 3 days. Depending on the value you enter, the decryption will be delayed by x days.

Note: In order to start the encryption process immediately, enter the value 0 here.

- 5. **Do not decrypt** is the default setting, which is intended to prevent unwanted decryption. It is deactivated as soon as you enter a value for the delay.
- 6. Click **OK** to confirm your settings.
- 7. The following message appears in the status bar of the client computer that is being decrypted.

1.2.3 Override policy settings (BitLocker)

To disable specific encryption settings on individual client computers, you can override the respective policy settings.

Warning: Note that the policy settings will not be re-enabled until you undo the reconfiguration.

Please do the following:

- 1. Open the **Agent remote control** in the **Operating** node of the DriveLock Management Console.
- 2. Select the DriveLock Agent you want to change the policy settings for.
- 3. From the context menu, select the menu item **Disk encryption properties...**.

Note: Please note that a connection between DES and DriveLock Agent must exist to display the encryption properties.

4. On the **General** tab you can see information about DriveLock Agent encryption. Click the **Reconfigure agent...** button.

 If you select the Override policy settings option and keep the Override general deployment settings option checked (default), the DriveLock Agent will be decrypted immediately and BitLocker will be disabled (see figure below).

- 6. By checking the **Encrypt local hard disks** option, the encryption settings from the policy (e.g. algorithm or fast encryption) are applied.
- 7. If you select the **Do not decrypt in case of configuration changes** option, the corresponding policy option (Do not decrypt) is overwritten.
- 8. If you click **OK** now, your settings will be applied to the selected client computer with immediate effect.

1.3 Sample configuration

Please find below a sample configuration for encryption involving the user entering a password on the client computer.

To quickly and easily encrypt the drives on your client computers, follow the instructions below in the specified order.

This sample process starts with the licensing of DriveLock BitLocker Management and ends with the encryption of the drives on the client computers.

Mote: For more information on the individual steps, see the cross-references.

- Create a new policy or use an existing one.
 In this document, the policy is referred to as the 'BitLocker Policy'.
- 2. Enter the appropriate licenses in the policy and license all computers.
- 3. In the policy, open the **Encryption** node and select **Hard disk encryption** in the **BitLocker Management** sub-node. Read more here.
- 4. First, create the encryption certificates.
- 5. Open the Deployment settings and specify the notifications you want the user to get.
- 6. Next, specify the Pre-boot authentication settings.
 - On the Authentication type tab, select BitLocker pre-boot authentication. Check the Automatically unlock all data partitions box.
 - On the **Password options** tab, select the **User must change password** option and specify the complexity requirements you want for the password.

Apply your changes by clicking OK.

- 7. Specify the following in the Hard disk encryption settings:
 - Open the General tab.
 - 1. First of all, check the **Encrypt local hard disks on Agent computers** option.
 - 2. Then set the entry **AES-XTS (256 bit key length)** to the highest position in the encryption algorithm priority.
 - 3. Optionally check the **Configure encryption settings per drive** box and select the encryption algorithm mentioned above for the drives C: and the

expected data drives via the **Settings** button. You can also specify **Not encrypted** if you do not require encryption.

- 4. Click **OK** to close the dialog.
- In the Initial encryption section, check the Encrypt only used disk space (fast initial encryption) option; in the Initial protection section, select '0' for the number of days the decryption will be delayed.
- Next, open the **Recovery** tab and select the first option **DriveLock Enterprise** Service.

Click **OK** to close the dialog.

- 8. Save and publish the policy.
- 9. Your settings will be activated the next time the client computer's configuration is updated.
- 10. Depending on the setting, the hard disk encryption is executed immediately on the client computers or after the user enters the password.
- 11. Solution Note: For more information on installing the DriveLock Agent or on policy management in general, please refer to the DriveLock Installation or Administration Guide at https://drivelock.help/.

1.4 Recovery

1.4.1 Recovering encrypted hard disks

If users can no longer access their hard disk (system partition) encrypted with DriveLock BitLocker Management , for example because they have forgotten their BitLocker password, the recovery certificate and the associated private key must be used to provide access.

Note: The upload of the recovery data starts when all drives that are needed for encryption have begun encrypting.

In this case, please start the recovery process. For this purpose, DriveLock offers you two possibilities:

 In DriveLock Operations Center, select the appropriate computer from the Computers view. Open the context menu and select the BitLocker submenu and then Show recovery key.

Enter the certificate or certificate file information and the corresponding password.

2. In the **DriveLock Management Console**, select the **Operating** node and open the context menu for **Agent remote control** to select the **BitLocker Management recovery** menu item (see figure).

📑 DriveLock		Remote computer	Logged	l-on user	Last contact	DriveLock Versi	Age

	Help						

Here, the recovery wizard opens and guides you through the respective steps.

1.4.2 Recovery process

To recover access to an encrypted hard disk, Please do the following::

- 1. Open the Recovery Wizard (from the DriveLock Operations Center or the DriveLock Management Console).
- 2. In the first dialog, select the **BitLocker recovery key** option.

Disk Recovery X
Recovery type and source Select the type of recovery to perform and the source of recovery information.
Select the type of recovery to be performed: C Emergency logon Use this option when a user needs to log on and does not have a password for the Pre-Boot Authentication or forgot the password. BitLocker recovery key Use this option if a computer with an encrypted hard disk does not start and you need to recover data from the hard disk. Recovery information is retrieved from: C Recovery files (copied from the client computer) DriveLock Enterprise Service
< <u>B</u> ack <u>N</u> ext > Cancel

Note: For information on emergency logon to the DriveLock PBA, refer to the corresponding chapter.

Select where the **recovery information is retrieved from:**.

Note: Which option you select, depends on your settings in the encryption settings dialog. We recommend the DriveLock Enterprise Service option.

3. In the next dialog, select the location of the certificate and/or private key (*.PFX file).

Disk Recovery X
Certificate private key file Select the required certificate private key file and password.
Encryption certificates and private keys are needed for BitLocker Management recovery. Please specify where certificates and private keys are stored.
O Windows certificate storage
◯ Smart card
File system (PFX files)
Data recovery certificate private key file (PFX)
Private key file password
< <u>B</u> ack <u>N</u> ext > Cancel

You can also access the information stored in the Windows Certificate Store.

Note: If you specified earlier in the encryption settings dialog that the recovery information resides in the file system, please enter the matching password for the private key here.

- 4. Next, select the client computer that needs recovery from the list. Use a filter, if required.
- 5. Continue by requesting a recovery key in the next dialog.

Note: The challenge-response feature will be fully available in the next version.

- 6. Wait a moment while DriveLock retrieves the recovery information.
- 7. The next dialog issues the recovery key.

Mote: Select the drive defined as system partition on the client computer.

Disk Recovery	×
Creating recovery information Creating recovery information	
The recovery data was retrieved successfully. Please forward the data retrieved to the end user or use the key directly.	
Drive to be recovered: C ~ Recovery key 304117-478742-036190-637087-061743-]
423313-076505-639540	
< <u>B</u> ack Finish	Cancel

8. Provide the user with the recovery key.

9. Last, the user enters this key in the **BitLocker recovery** dialog when starting the client computer.

- Note: Note that this recovery key represents a major security risk. For this reason, BitLocker Management immediately initiates a password change by the user and replaces the recovery key with a new one.
- 10. The Change BitLocker Password wizard starts on the client computer and the user must specify a new password.

11. As soon as this is done, the user can enter this password when starting up the client computer.

1.5 Taking over native BitLocker

1.5.1 Integrating existing BitLocker environments

It is now simple to include hard disks and data drives from client computers that have already been encrypted in advance with native BitLocker into DriveLock BitLocker Management. DriveLock BitLocker Management allows you to control encryption and decryption from a central point without having to deal with the encryption state of individual client computers.

Enable the **Manage existing BitLocker environment** option in your BitLocker policy to specify that DriveLock can start the integration. By assigning the policy to the respective client computers, BitLocker Management is activated.

Note: If you do not enable this option and there are drives in your environment that have been encrypted with BitLocker before, DriveLock ignores these drives. They remain encrypted but cannot be managed with DriveLock BitLocker Management.

System drives differ from data drives:

• **System drives:** DriveLock automatically takes over system drives that have been encrypted before with native BitLocker; they do not necessarily have to be re-

encrypted. In the background, DriveLock adapts the algorithms and exchanges protectors (even External keys are deleted and re-created). If the encryption algorithms match, this is a very quick process; if they do not match, DriveLock re-encrypts the drives. Depending on the system and partition size, this may take a longer time.

Note: If the option Encrypt only if pre-boot login succeeded at least once was enabled on the Encryption protection tab, the drive must be decrypted first. After successful login to the DriveLock PBA, the drive is then re-encrypted.

Since users unlock the system drive directly by logging on to the system or entering their BitLocker password, no further action is required from the user.

 Data drives: Data drives are neither unlocked nor integrated in DriveLock BitLocker Management automatically. Users will have to take action here: A wizard pops up on the client computer where the user selects the partitions that need to be unlocked. Then, the user enters the original BitLocker password and specifies a new one. Note that a password entry is only required if the User must change password option has been enabled in the Password options dialog before. However, if this option is not selected and a password is preset, make sure to let the users know. In this case, a password change is not required; the users simply select the drives that need to be unlocked and enter their original BitLocker password.

Recovery keys: DriveLock BitLocker Management creates new recovery keys when it integrates the native BitLocker environments.

Encryption algorithms: If you adhere to the Windows default settings for encryption algorithms, DriveLock BitLocker Management can take over native BitLocker environments easily and quickly.

1.5.2 Additional modifications of BitLocker policies

You will need to modify an existing BitLocker policy in the following cases:

- if the client computers the existing BitLocker policy is assigned to have changed (e.g. drive changes) or
- if the settings for encryption or decryption have changed, or
- if you upgrade your DriveLock agents to a higher version. For more information about updating the DriveLock Agent, refer to the Release Notes.

The encryption behavior changes depending on the setting in the respective policy.

Mote: Policy changes are applied in the next configuration update.

These are the different scenarios:

• Re-encrypt already encrypted partitions

If the encryption algorithm is changed in the policy, the system will decrypt the partition first and then immediately encrypt it again using the newly set algorithm. For example, if you had specified the algorithm AES 128 bit key length and changes it to AES-XTS 128 bit key length, encryption restarts.

• Exchange protectors of already encrypted partitions without new encryption If the encryption algorithm already corresponds to the algorithm specified in the

policy, this approach is followed.

There are two possible reasons for such a behavior:

- In the first case, a change from TPM/PIN to TPM (and vice versa) leads to the exchange of protectors.
- In the second case, DriveLock is to integrate existing BitLocker partitions that have already been encrypted with the algorithm specified in the policy.

Decrypting partitions

Decryption is always triggered if either

- the Encrypt local hard disks on agent computers option has been unchecked or
- a drive is set to **not encrypted** in the **Configure encryption settings per drive** option, or
- the Bitlocker Management option is disabled in the License Options under Licensed Computers.

• Encrypt newly added partitions

The encryption should always be triggered when new hardware or a new drive are added (in the **Configure encryption settings per drive** option). By doing so, you ensure that all data on new computers and drives is protected by BitLocker.

1.6 DriveLock Agent

1.6.1 BitLocker pre-boot authentication

Please note that **an English keyboard layout** may be enabled when logging on to the BitLocker PreBootAuthentication (see figure below). Use the INSERT key to display the entered password if in doubt.

Warning: Please inform the users of this information and point out that special characters on an EN-US keyboard are occupied by other key combinations and that Y and Z are interchanged.

1.6.2 BitLocker Management on client computers (DriveLock Agent)

When your BitLocker policy is assigned to the appropriate client computers, disk encryption is initiated. Depending on the settings you specified in the Pre-Boot authentication settings dialog, encryption starts with or without the user having to enter a password.

Mote: Please provide users with the appropriate password information.

The user may also redefine the password later. The **DriveLock Agent** on the client computer provides the **Change BitLocker password** button on the **Encryption** tab for this purpose.

1.6.3 Encrypting client computers

On the client computers, the hard disk encryption and the corresponding password entry are carried out as follows:

- 1. In one case, the user starts the (unencrypted) client computer and logs on to Windows as usual. In the other case, the user is already logged in and the DriveLock Agent has just been assigned the new BitLocker policy.
- 2. Two options are available:
 - a. If you specified a set password, the encryption process starts automatically and immediately without the user's interaction (no password entry or definition required).

The user can only follow the encryption process in the status bar.

When the encryption process is finished, DriveLock issues the message described in item 5.

b. If the user must specify their own password, a wizard starts where the user defines an authentication password.

- 3. In case b. the user now assigns a password. The policy requirements are checked and only valid passwords are accepted.
- 4. As soon as the password has been defined and confirmed, the encryption process starts.
- 5. When this process is complete, the following notice appears on the user's screen:

BitLocker Disk	Protection	
	DriveLock BitLocker Management Installation	
DriveLock Bitl	Locker Management has finished encrypting your hard disk.	
Continuing in	4:35	Close

6. The next time the client computer starts up, the user enters the BitLocker password as pre-boot authentication thus unlocking the encrypted system partition (and the data partitions, where applicable).

In case a. the client computer starts without the user having to enter a password.

1.6.3.1 Delay encryption

Users can delay the encryption by selecting the appropriate time in the notification (see figure). Depending on how many hours are specified as the maximum value on the Execution options tab, the user can specify the time until the dialog is displayed again in the **Delay by** dropdown list. Encryption is then delayed for that long. When the specified maximum time is used up, encryption starts. It also starts if the user does nothing while the dialog is displayed or clicks on **Encrypt**.

(i)	VE Lock Management				
Your computer will be				L.	,
Encryption may affect the encryption proces (depending on your ac To start encryption im	s. Select a de Iministrator's p	lay time fr preference	om the es) and	e dropdown list d click Later.	can delay
Start encryption in 4:53	Delay by	10min	~	Later	Encrypt

1.6.4 Integrating data partitions with existing BitLocker

There are two settings in the **Password options** of the BitLocker policy that determine how to unlock data partitions that have been encrypted with native BitLocker and that are to be integrated in DriveLock BitLocker Management:

or

• the BitLocker password is preset.

Pre-boot authent	ication settings Prope	rties	?	\times
Authentication type	e Password options			
Valid for: 🗧 Bitl	ocker pre-boot authenti	cation		
Bit Locker passwo	ord:			
Password	•••••			
Confirm	•••••			
User cannot change password User must change password				

Depending on the selected option, a different wizard opens on the client computer.

• One wizard prompts the user to change the password on the following dialog pages.

• The other wizard only contains information on how to integrate the native BitLocker environment:

The second wizard dialog is the same in both cases; here, you are asked to select the data partition you want to unlock.

Select the drive (or the drives) you want to unlock and enter the original BitLocker **password**. Then you can click **Next**.

BitLocker encr	ption	
	s with native BitLocker g data partitions were already locked in ad-	vance with
BitLocker.	g data partitiona nore alleday locked in da	
Before you can r	nanage these partitions with DriveLock, the	v must first be

		2014 D 2014 D
	< Back Next > Car	icel Help

If a new password is required, a further dialog appears where a new password must be assigned.

Complete the final dialog by clicking **Finish**.

C'	Note: In the background, DriveLock BitLocker Management implements the integ-
	ration by replacing protectors and taking over encryption algorithms.

1.7 Tracing BitLocker actions

In the DriveLock Operations Center (DOC), events can be used to track all BitLocker actions.

You can also use tracing in detailed diagnostic logs. For example, this is important in order to trace errors during the import of original BitLocker environments. The tracing file is called DlSvcBitLocker.log, see figure below. Here you can easily identify the actions DriveLock performs when taking over existing BitLocker environments.

DISvcBitLocker.log - Notepad

You can enable the creation of trace logs via the command line, with the help of the DriveLock Management Console or via the DriveLock Support tool DLSupport.exe (which resides in the DriveLock installation directory).

2 DriveLock Pre-Boot Authentication

The DriveLock Pre-Boot Authentication (PBA) can be used for both DriveLock encryption technologies - BitLocker Management and Disk Protection (Full Disk Encryption, FDE). A separate license is required for DriveLock Pre-Boot Authentication for BitLocker.

Warning: Note that the PBA only works on UEFI systems in Windows 10 environments.

The older BIOS PBA can only be used in Windows 7 or 8.1 environments, it is no longer updated and is only used for DriveLock Disk Protection (FDE). When you implement BitLocker Management on BIOS systems, the native BitLocker PBA is used.

Note: For information on the PBA with DriveLock Disk Protection, see the corresponding chapter in the Administration Guide in the Product Documentation section on the DriveLock.Help website.

DriveLock Pre-Boot Authentication for BitLocker Management includes a range of benefits:

- Login with user name / password
- Recovery using Challenge-Response procedure
- Single sign-on (SSO) for Windows logon
- Login with Smartcard
- Support for other keyboard layouts and virtual keyboard
- Exchangeable PBA background images

2.1 Policy configuration with pre-boot authentication settings

Note that the DriveLock PBA for BitLocker Management requires a separate license, which is based on the BitLocker Management license.

2.1.1 License DriveLock PBA

License **DriveLock PBA for BitLocker** as described in the chapter Licensing BitLocker Management.

2.1.2 Pre-boot authentication settings

To configure the DriveLock PBA for BitLocker, open the **Encryption** node, then select **BitLocker Management** and then **Hard disk encryption**. Start by configuring the **authen-tication type**.

2.1.2.1 Authentication type

Open the **Pre-boot authentication settings** and select **DriveLock pre-boot authentication** on the **Authentication type** tab.

Note: If this option is not available, verify that the DriveLock PBA option is correctly licensed and that you saved and reopened the policy after activating the license option.

User authentication is required to boot the client computer. To authenticate the user, the user name and password or 2-factor authentication can be used. All emergency logon methods are available.					
The BitLocker PBA is used instead of the DriveLock PBA when there is a BIOS system in place and/or no DriveLock PBA license available.					
Global options					
Automatically unlock all data partitions Mitigate TPM security to eliminate repeated entry of a recovery key (e.g. in connection with a docking station)					
		ОК	Cancel	Ap	ply

Warning: This option is only supported for computers running Windows 10 and UEFI firmware. We do not support server systems, older systems or systems with legacy BIOS.

Please note the following:

- If the client computer does not meet the requirements, the **BitLocker pre-boot authentication** option is automatically used.
- The **Automatically unlock all data partitions** option has no effect on DriveLock preboot authentication because data drives are generally unlocked automatically.

You cannot select any options on the **Password options** tab. If you want to configure settings on this tab (e.g., for computers where DriveLock pre-boot authentication cannot be used), you must temporarily enable the **BitLocker pre-boot authentication** option.

2.1.2.2 Logon methods

The following options are available on this tab:

Select the **Enable single sign-on for Windows** option so that users only need one logon to the client computer. The Windows login screen will no longer appear.

The following authentication methods are available:

- Local user access: This option is enabled by default. This method allows local Windows users to authenticate to the system using their local Windows user name, password, and local system name.
- **Domain user access (with password)**: This method allows Windows domain users to authenticate themselves to the system with their Windows domain user name, password and domain name.

Warning: Users can only log on to the domain at all if the Windows and Preboot options are set.

• **Domain user access (with token)**: This method allows Windows domain users to authenticate themselves with a smartcard/token and PIN.

Enable logon using password tokens: This method allows the pre-boot authentication for a password token user. If you check this option, then you need to select at least one more Windows authentication.

Warning: Prior to configuring the DriveLock PBA for token access only, make sure that a valid token exists for both the PBA and the Windows logon (unlock).

Other options in the dialog:

- The **Maximum number of logins before lockout** option causes a user to be locked for a certain period of time after the specified number of failed logins to protect the system from a brute force attack with automatic logon scripts. Change the default values according to your corporate security policies.
- If you are using certificates for authentication, you can specify the number of days after which DriveLock alerts users before certificates expire.
- The **Count failed logons globally for all users** option is enabled by default. Instead of counting up failed attempts for a single user, the failed attempts counter is incremented independently of users.

2.1.2.3 Users

On this tab, you specify the settings for DriveLock PBA users.

BitLocker Management adds all users who have successfully logged on to Windows to the pre-boot authentication database. For this reason, the option **Automatically add Win-dows users to pre-boot authentication on logon** is set by default. If you deselect this option, users are no longer added automatically. You can add users manually using the **Add** button.

If you activate the option **Always use downlevel logonnames during single sign-on**, the user logon is only possible with the so-called downlevel logon names. They take the format "DOMAIN\username". Logon with User Principal Names such as benutzername@domain.org is not permitted anymore.

2.1.2.4 User synchronization

The option **Synchronize Active Directory users to pre-boot authentication** is not enabled by default because AD users are automatically entered into the PBA database when they log on to the PBA.

Use this option only if you want to preconfigure the PBA by manually adding users from AD to the PBA user database before they log on.

In this case, add the appropriate AD groups and users that you want to synchronize to the PBA database.

As an initial password, you can assign a **fixed password** (identical for all users), the **user name**, or any available **AD property value**.

Note: Please note that the members of the "Domain Users" group will not be synchronized. This group employs a mechanism based on the user's "primary group ID" to determine membership, and does not typically store members as multi-value linked attributes.

2.1.2.5 User wipe

To configure user wipe, select the **User-wipe** tab, check **Enable user-initiated wipe**, and enter a wipe suffix.

Enabling this option allows a valid PBA user to make the system inaccessible.

2.1.2.6 Appearance

On this tab you can define how the DriveLock PBA is displayed to users on their client computers.

- There are several **background images** to chose from. Choose one of them.
- You can also select your own **custom background image** by selecting one from the file system or the policy file storage.
- The **Show password** option allows the user to briefly view the entered password in plain text. Currently, this option is not yet available for the Drivelock PBA, but only for BitLocker Management.
- If required, you can enter your own display test in the text box below the **Show pre-boot user information message** option.

2.1.2.7 Network pre-boot (UEFI)

For more information on this tab, please click here.

2.1.2.8 Emergency logon

Use these settings to specify which logon methods are available in case a user is no longer able to log on to the DriveLock PBA (for example because the password is missing).

We recommend using the default settings.

- Allow emergency logon with user name: This default option lets users log on in an emergency by entering their name. This applies to Windows domains or local Windows user password accounts added to the PBA user database. It permits a one-time pre-boot access to the system.
 - Note: Note that a user must have successfully logged in to pre-boot authentication at least once before this feature is available to that user. Users who have never logged in before, must use the Emergency logon without user name procedure.
- **Single sign-on after emergency logon** allows users to log on to Windows and work with it if they forget their password even if an administrator has not yet reset the password.
- Emergency logon without user name allows a one-time pre-boot access to the system for all users who have never been logged into the system before. Single sign-on (SSO) is not possible in this case.

• If you enable the **Emergency logon for users of token devices** option, make sure you set the appropriate settings for logon with tokens on the **Logon methods** tab.

2.1.2.9 Self-wipe

Self-wipe has two main application scenarios. Either you want to protect the data on a lost PC that no longer connects to the DES and/or you want to force mobile users to connect to the corporate network on a regular basis.

To configure self-wipe, select the **Self-wipe** tab, check **Enable self-wipe when computer is offline** and configure the appropriate settings as described in the dialog.

After the specified offline time expires, DriveLock deletes the PBA database.

2.1.3 Override policy settings (DriveLock PBA)

To disable specific pre-boot authentication settings on individual client computers, you can override the respective policy settings.

Warning: Note that the policy settings will not be re-enabled until you undo the override option.

Please do the following:

- 1. Open the **Agent remote control** in the **Operating** node of the DriveLock Management Console.
- 2. Select the DriveLock Agent you want to change the policy settings for.
- 3. From the context menu, select the menu item **Disk encryption properties...**.
- 4. On the **General** tab you can see information about DriveLock Agent encryption. Click the **Reconfigure agent...** button.
- 5. Set the **Override policy settings** option and leave the **Override general deployment settings** option checked (default).

Reconfigure BitLocker Management	х
Reconfigure bittocker management	
You can override BitLocker Management settings in your company policy on agents. This replaces the settings configured here with the company policy th is applied to the agent computer.	
Override policy settings Override general deployment settings Incrypt local hard disks Do not decrypt in case of configuration changes	
Pre-boot authentication settings	—
Pre-boot authentication type	
No pre-boot authentication	
BitLocker Pre-Boot Authentication	
DriveLock Pre-Boot Authentication	
Override authentication methods Windows Preboot	
Local user access Domain user access (with password) Domain user access (with token) Enable logon using "password tokens" Require token PIN on Windows logon	
Ovenide emergency access methods Allow emergency logon with user name Single Sign-on after emergency logon Allow emergency logon without user name Allow emergency logon for token users	
OK Cancel	

6. Select the appropriate PBA in the Pre-boot authentication settings section.

Note: If there is no TPM, the No pre-boot authentication option is automatically grayed out (see figure above).

- 7. The **Override authentication methods** and **Override emergency access methods** options are active only if you selected DriveLock pre-boot authentication. Both options override the corresponding settings in the policy. For more information, see the Logon methods and Emergency logon chapters.
- 8. If you click **OK** now, your settings will be applied to the selected client computer with immediate effect.

2.1.4 PBA settings in the DriveLock Operations Center (DOC)

You may want to disable the PBA, for example, when updates are pending that require a reboot.

Mote: This setting applies to both DriveLock and BitLocker PBA.

In the DOC, open the **Encryption** dashboard. Get a list of encrypted computers from either the **Computer encryption state** widget or the **Encryption information** widget. Select the appropriate computer. You can also select it directly in the **Computers** view.

In the context menu, select **Run actions on computer** and then **More actions**. In the next dialog, select **Show all actions**.

Encryption state	= 'Fully Encrypted' $ imes$		
			Update configuration/policy
Drag a column header her	e to group by that column		🕞 Send computer inventory
Stat 🝸 Locl 🝸	Name 1 C	DS : 🔻	🔒 Show inventory

	⊰ Show trace files		🔒 Stop unlock
	Run actions on compute	ers 🕨	🖉 More actions
• = • 4	PBA emergency logon		en-US NT-AUTORITY\SYSTEM
 A 	BitLocker	Þ	de-DE simpsons\nelson

In the Pre-Boot Authentication section, check Suspend PBA and then scroll down a bit to view the settings:

Pre-boot authentication (PBA)	
Suspend PBA	
 In the time from For specified number of restarts 	

You can specify this setting for a certain number of restarts or for a certain period of time. This action is defined once, i.e. it can be renewed at any time.

The status is displayed in the computer details.

2.2 Network pre-boot authentication (UEFI)

This add-on to the DriveLock pre-boot authentication enables simplified management of client computers (Drivelock Agents) in network environments.

Upon reboot, the operating system drive of a client computer can be automatically unlocked if it is connected to a corporate network via cable. In this way, client systems that meet the hardware requirements can be booted in Windows without user interaction.

You can, for example, configure the feature so that client computers can be booted automatically only when they are on the network. Booting without a network is not possible!

If no network connection is available, alternatives may be permitted (e.g. emergency logon requiring user and password entry).

This also makes it easier for administrators to roll out software patches to unattended client computers, for instance.

Note the following limitations:

- Only UEFI firmware is supported (The network PBA for BIOS will remain functional only when using DriveLock Disk Protection)
- Only wired network is supported
- Only network adapters that UEFI offers for PXE boot are supported
- The DriveLock network PBA does not provide any network drivers of its own

The following rules apply:

- The network PBA and the DriveLock Enterprise Service (DES) must have the same date / time
- To negotiate the key pairs, the secure network connection under Windows to the DES is required (HTTPS/SSL)
- Connections via proxy are not supported in the network PBA
- In the DriveLock Operations Center (DOC), automatic logon can be temporarily disabled for each DriveLock agent (more information can be found here)

Warning: To ensure that the network PBA works, a server connection must be specified in the policy in the **Server connections** subnode in the **Global settings**.

2.2.1 Network pre-boot (UEFI)

Note: The settings on the Network pre-boot (UEFI) tab are available for both DriveLock Disk Protection and DriveLock BitLocker Management (depending on the license) as the DriveLock pre-boot authentication is used for both features.

The following settings are possible on the tab:

- Check the Enable network pre-boot authentication option to enable the feature. However, you must also select at least one of the two options below (automatic or AD logon).
- 2. The **Allow automatic logon to the network** option enables authentication to the client computer without any user interaction, provided that a network connection is available.

Once the policy with this setting is assigned to the DriveLock Agent (client computer), this is what happens in the background:

- a special network user is created in the PBA database ('AutoLogon user') along with an auto-generated user password
- an RSA key pair is exchanged between the DriveLock Agent and the DriveLock Enterprise Service (DES)
 - Note: Automatic logon to the PBA will only occur if this key exchange is successful.
- Warning: Note that the client operating system can only be started if there is a network connection between DriveLock Agent and DES.

See this use case for more information.

- 3. When you select the automatic login, the **Allow other logon methods** option is always also selected by default. This option will guarantee that the authentication is still possible even without a network connection.
 - Warning: If you remove the checkmark here, the possibility of a local logon or logon via challenge response method no longer exists. In the event that the configuration becomes invalid, the system cannot be booted any longer. All user accounts are automatically deleted from the PBA, AD synchronization and user import are no longer enabled!
- The Number of network logons to be successfully completed before disabling failsafe option is set to the default value of 3.

Context: An additional local AutoLogon user is configured in the network PBA to serve as a failsafe in case the network PBA is unable to boot over network.

When the specified successful network logons have been performed, the local AutoLogon user is deleted and after that it is only possible to boot via the network autologon.

Warning: This option can only be set initially, it has no effect on systems that are already running. For safety reasons, make sure not to select a number too high.

- 5. Allow logon via Active Directory (AD): Select this option to obtain credentials from the AD.
- Allow network logon for all AD users: Select this option to ensure that users can be logged on who are already known in the AD but not yet in the PBA database. See this use case for more information.
- 7. **User logon must only occur via network authentication**: The network PBA only allows logons if the user credentials can also be verified online against AD. This means that a network logon is a prerequisite; without a network, only a challenge-response procedure is available.
- 8. **Number of automatic retries until the network connection is established**: Specify how often the system should automatically try to establish a network connection.
- 9. **Time between retries**: Specify the seconds that may elapse between retries. Default value is 5 seconds.

Example: To ensure that a router has enough time to establish a network connection, you can increase the number of automatic retries and adjust the pause accordingly. If the pause is set to 0, the process will be repeated immediately.

2.2.2 Use case 1: Automatic logon

Certain use cases require that the operating system of a client computer may only be started if there is a network connection, e.g. ATMs or special notebooks that may be used exclusively in the corporate network. In the event that this type of computer is stolen, the operating system can no longer be started without a network connection and the hard disks cannot be decrypted accordingly.

Follow these steps for configuration (the settings on the other tabs are explained in the corresponding descriptions):

Pre-boot authentication settings Properties				?	×	
Appearance	arance User synchronization Users		ers	User-wipe		
Authentication	Authentication type Passw		ions	Log	on meth	ods
Emergency log	Emergency logon		Network preboot (L		boot (UE	FI)
Enable network pre-boot authentication Select either automatic or Active Directory logon or both if you want the client operating system to start automatically when the client is connected to the network.					the	
Allow auton (No user int	_	on to the network required)				
Allow other logon methods Number of network logons to be successfully completed before disabling failsafe					▲ ▼	
Note that logging on without a network connection is no longer possible once the specified number of successful network logons is reached!						
Allow logon via the Active Directory (AD)						
 Allow network logon for all AD users This allows users to log on even if they have not previously logged on to the client operating system User logon must only occur via network authentication 						
Number of automatic retries until the network 3						
Time between retries: 5 seconds						
		ОК	Ca	ncel	Ap	ply

- 1. Select the basic setting **Enable network pre-boot authentication**.
- 2. Select Allow automatic logon to the network.

- 3. Remove the checkmark at Allow other logon methods.
- 4. Leave the default value for failsafe at 3. This way you can make sure that only after 3 successful network logins there is no other way to log on. This option is intended for both testing purposes and as a failsafe.
- 5. Leave the default value 3 at Number of automatic retries until network connection is established.
- 6. Likewise, you can leave the pauses between retries at 5 seconds.
- 7. Apply your changes by clicking OK.

2.2.3 Use case 2: Network login for all AD users

Two use cases:

- An employee (new user) needs to log on to a particular client computer in Windows, even though the user has never logged on there before. The client computer is connected to the corporate network.
- A user has forgotten or changed their password. No challenge-response procedure needs to be performed when the client computer is connected to the network. The administrator can reset the Windows password and the user can log in to the network PBA via AD. If the AD logon is successful, a single sign-on into Windows takes place and the new user credentials are synchronized back into the PBA.

Follow these steps for configuration (the settings on the other tabs are explained in the corresponding descriptions):

Pre-boot authenti	ication s	ettings Properties			?	×
Appearance	User synchronization Users		ers	User-	wipe

Time between retries: 5 seconds						
		ОК	Car	ncel	A	pply

- 1. Select the basic setting Enable network pre-boot authentication.
- 2. Select Allow automatic logon to the network.
- 3. Keep the check mark at Allow other logon methods.
- 4. Leave the default value for failsafe at 3. This way you can make sure that only after 3 successful network logins there is no other way to log on. This option is intended for both testing purposes and as a failsafe.
- 5. Select Allow logon via the Active Directory (AD).
- 6. Select Allow network logon for all AD users.
- Based on whether or not you want to enforce network logon, select or uncheck the User logon must only occur via network authentication option.
- 8. Leave the default value 3 at **Number of automatic retries until network con-nection is established**.

- 9. Likewise, you can leave the pauses between retries at 5 seconds.
- 10. **Apply** your changes by clicking **OK**.

2.2.4 Network PBA settings in the DOC

To configure network pre-boot authentication settings in the DriveLock Operations Center, proceed as follows:

- 1. Select the **Computer** section and open the BitLocker dashboard.
- 2. Select the DriveLock Agent you want to change the settings for.
- 3. In the detail view on the right side, open the drop-down menu and select Configure view.

TESTPC01		:
△ Compliance s ¹	4	Delete computer
	ŀ	Unlock computer
	M	Run actions on computers
	ŀ	PBA emergency logon
-		BitLocker
	***	Set password
	Ē	Reset password
	•	Show recovery key
		View
Click to navigate to the re	ខ្មែរ	Configure detail view

- 4. Select **Network Pre-Boot Authentication** and check **Show** and optionally **Expand** (depending on whether you want to display the item open right away).
- 5. The Allow automatic logon to the network option can only be enabled or disabled.

Note: The policy with this setting must have been assigned to the DriveLock Agent (client computer) and applied there.

2.3 Settings for emergency logon

If users are no longer able to log on to pre-boot authentication (for example, because they forgot their password), you will need to configure the emergency logon settings.

Please do the following:

- To start the recovery/emergency wizard, open the **Operating** node in the **DriveLock** Management Console and right-click the **Agent remote control** sub-node to open the context menu.
- 2. Here you select **BitLocker Management recovery** and then **BitLocker Management recovery / emergency logon** (see figure).

3. The recovery wizard opens.

Select **Emergency logon**. If your recovery keys are sent to the DriveLock Enterprise Service, do not change the default setting **DriveLock Enterprise Service**. To specify the path to the required recovery keys later, select **Recovery files (copied by agent computer)**.

Disk Recovery	×			
Recovery type and source Select the type of recovery to perform and the source of recovery information.				
Select the type of recovery to be performed:				
Emergency logon Use this option when a user needs to log on and does not have a password for the Pre-Boot Authentication or forgot the password.				
O BitLocker recovery key Use this option if a computer with an encrypted hard disk does not start and you need to recover data from the hard disk.				
Recovery information is retrieved from:				
 Recovery files (copied from the client computer) 				
DriveLock Enterprise Service				
< <u>B</u> ack <u>N</u> ext > Can	cel			

- 4. For the emergency logon procedure you need the private key of the recovery certificate. In the second dialog, specify the storage location, either Windows certificate store, a smart card or a PFX file together with the respective password. For more information on certificates, please click here. Click **Next**.
- The third dialog provides a list of computers where you can select the computer to restore. Check the option **only show the most recent entry for each computer**. Click **Next**.
- Next, you will see the dialog for entering the user's request/recovery code.
 Enter the code in the appropriate text boxes (see figure). You can optionally specify the name of the user.

Warning: The recovery code provided by the user is mandatory.

Disk Recovery	Х
Specify recovery code Select user to enable to log on and type the recovery code from the PBA screen.	
Users must initiate a request for a one-time password from the Pre-Boot Authentication (PBA) screen by selecting "Emergency" or pressing F3. Then after entering the user name a recovery code is generated. Recovery for specific user	
Recovery code as specified by the user Z+SGJ N4G-R Y+3

< <u>B</u> ack Finish Cancel

- 8. Tell the user the **response code**.
- 9. Click Finish.

2.4 DriveLock Agent

2.4.1 Installing the DriveLock PBA on the DriveLock Agent

Please note the following:

- 1. Once the client computer has started, a message appears indicating that the DriveLock PBA is being installed.
- 2. When confirmed, the computer is restarted.

Mote: In case no user is logged in, the computer is restarted immediately.

3. After restarting the client computer and logging on, another dialog box appears (see figure), informing the user that DriveLock PBA is now active.

DriveLock BitLocker Mana	gement
	/eLock
DriveLock	PBA Installation
Entre Lock	From now on you need to authenticate in the DriveLock PBA at every system start or reboot before you can access your hard disk. You can authenticate using your Windows credentials. As soon as the computer restarts, enter your Windows user name and your password. Choose the correct domain.
Continuing in 5:57	Close

4. At the same time the encryption starts; restarting or shutting down the computer is now possible at any time.

2.4.2 Login to the DriveLock PBA

Please consider the following when logging in:

- 1. As soon as the client computer is booted, a short text is displayed indicating that DriveLock pre-boot authentication is active.
- 2. Immediately after the text display and even before the start screen is displayed, hot keys can be used.
- 3. The login page opens when you press any key or click the mouse button.

Using function keys is not required anymore, but possible.

4. Please enter the Windows credentials on the login page.

Warning: The most recently logged on user is not saved or displayed for security reasons.

Please note the following:

- Please note that the user must have previously logged on to Windows if you have selected the option "Synchronize Windows users automatically". For more information, refer to the chapter User synchronization.
- You can also import users from Active Directory beforehand with a policy setting. For more information, refer to the chapter Users.

- Passwords must contain only ASCII-128 characters to ensure successful authentication in the PBA.
- 5. Click **Select another** to select the domain. A list of the available domains is displayed.
- If no keyboard is available (for example, on a tablet computer), an on-screen keyboard can be displayed by clicking the **keyboard icon** in the lower right corner.
 A green checkmark is displayed on the keyboard icon. The keyboard appears when the cursor is in a text field.

The speech bubble icon allows you to set the language of the login interface.

- 7. You can reach all fields and options also using <Tab>, <Shift-Tab> and the arrow keys, if there is no mouse available.
- 8. By selecting the language (in the figure '**GER**') in the lower right corner, you can select a different keyboard layout.
- 9. You can log in either by clicking the arrow next to the password or by pressing <Return>.
- 10. By default, the user is also logged on to Windows (Single Sign On). You can disable this feature in the policy.

2.4.3 Network pre-boot authentication

Once the policy containing the network PBA settings is assigned to the client computer and the computer is started, the following scenarios are possible:

1. The client computer is connected to the corporate network

When booting the client computer, a notification appears that DriveLock pre-boot authentication is active.

Then the following login screen appears, see the figure:

Mote: No user interaction is required.

Note: By clicking the key icon within 10 seconds it is possible to switch to the PBA login mode with user name and password entry, if enabled.

The next step shows the Windows login screen where the Windows credentials are entered.

2. The client computer cannot connect to the corporate network

As soon as the client computer is booted, the notification indicating that DriveLock pre-boot authentication is active also appears. However, the login screen now indicates that the automatic network login has failed. Depending on the configuration in the policy, the system will try to connect automatically a few times.

If no connection can be established, the user has the following options according to the policy settings:

• Try to re-establish the network connection

The following options are available from the **network icon menu** in the taskbar:

• Select another login method (user name/password entry), if enabled. Here, single sign-on is active and logging in to the DriveLock PBA is required only once.

Warning: Unless another login method is allowed, it is not possible to start the client computer's operating system without a network connection.

Note: For more information, including how to use shortcut and function keys, see the Login to the DriveLock PBA chapter.

2.4.4 Emergency logon with recovery code

Scenario: A user of a DriveLock Agent has forgotten their password and cannot authenticate to the DriveLock PBA. The user asks the administrator for help.

User and administrator now perform the following actions:

1. User action:

1. Select the Lost username or password option on the left side of the login screen.

2. A new login screen will then appear, displaying your request or recovery code.

Lost	iser name	or passwo	ord	
User Maching	Sign in to: Select an		Ċ	
MLO-1803-BL Recovery code				
Z+SGJ Response code	N4G-R	Y+3		
	Sign in op	otions		
	- AN			

3. Inform the administrator of the recovery code and machine name, including the user name if necessary.

Note: You must provide the machine name and recovery code while the user name is optional.

2. Administrator action:

- 1. You immediately launched the Recovery Wizard after the user notified you and now you have reached the input mask for the recovery code.
- 2. Enter the **recovery code** to generate the **response code**.
- 3. Now communicate the **response code** to the user.

Warning: The request code and the response code are both generated once and can only be used once.

3. User action:

 Enter the **response code** in the appropriate text boxes in the DriveLock PBA. In case you make a mistake while entering the code, you will be shown error digits in different colors.

If you have entered everything correctly, you can log back into the system by clicking the arrow button.

Lost us	er name or passw	ord

2. Sign in to Windows.

2.5 DriveLock PBA command line tool

The DriveLock PBA command line tool DLFDEcmd can be employed with both BitLocker Management and DriveLock Disk Protection (Full Disk Encryption, FDE). Use this tool, for

example, to view the status of the PBA or to initiate an automatic logon (autologon) to the client computer whenever Windows system updates are required.

Note: The display text is adapted accordingly depending on the preferred encryption method (Disk Protection - FDE or BitLocker Management).

Help on how to use the individual commands is available when you use the 'help' parameter to call the DLFdeCmd.exe program.

Please find below the detailed description of the individual parameters:

- SHOWSTATUS: Displays the current status of the encryption method you are using.
- CRYPTSTATUS: Displays information about the encryption status, such as the number of encrypted disks.
- ENABLEAUTOLOGON: Enables automatic logon as part of disk encryption for the next number of logons.

Enter the following:

- <user>: PBA user for automatic logon
- <domain>: Domain of the specified PBA user
- <password>: Password of the specified PBA user (* to enter the password, # to enter in a dialog)
- <count>: Number of reboots where automatic logon is activated. Specify 'forever' if you want the automatic logon to be activated indefinitely.
- [sso]: Add "sso" only if you want automatic login with Single Sign On.

Example: If you enter enableautologon hans dlse * 2, the user 'hans' from the domain 'dlse' will be automatically logged in at the next '2' reboots and the password will be entered in the command line.

Note: For automatic login with a smartcard or token, specify "token" for <user> and <domain>.

- DISABLEAUTOLOGON: Disables automatic logon.
- SHOWAUTOLOGON: Shows the settings for automatic logon
- ENABLERESETSP: Activates resetting the system protection interrupt vector list after the next reboot. Use this option after updating the system BIOS to store new interrupt

vector values and suppress the PBA warning messages. A single automatic logon is required to reset the interrupt vector list.

Please enter the information in <user> <domain> <password> here as well.

- DISABLERESETSP: Disables resetting the system protection interrupt vector
- SHOWRESETSP: Displays the current settings for resetting system protection
- ENABLEDELAYINST: Delays the installation of the hard disk encryption until "DisableDelayInst" is executed.
- DISABLEDELAYINST: Disables the delay and performs the disk encryption installation as configured in the policy
- SHOWDELAYINST: Displays the current status of the delayed installation

In the figure below, the autologon for BitLocker Management is disabled and the ENABLEAUTOLOGON command has not been set here.

```
C:\WINDOWS\system32>DlFdeCmd SHOWAUTOLOGON
DriveLock 19.2.0 : Data protection, encryption, and more
DLFdeCmd
                : Full disk encryption command line tool
                  (C) Copyright 2004-2019 DriveLock SE.
BitLocker Management auto-logon is currently disabled.
C:\WINDOWS\system32>DlFdeCmd SHOWRESETSP
DriveLock 19.2.0 : Data protection, encryption, and more
                : Full disk encryption command line tool
DLFdeCmd
                  (C) Copyright 2004-2019 DriveLock SE.
BitLocker Management system protection reset is not active.
C:\WINDOWS\system32>DlFdeCmd SHOWDELAYINST
DriveLock 19.2.0 : Data protection, encryption, and more
DLFdeCmd
                : Full disk encryption command line tool
                  (C) Copyright 2004-2019 DriveLock SE.
BitLocker Management installation will execute as configured.
C:\WINDOWS\system32>
```

2.6 Shortcut and function keys

If necessary, you can use hotkeys to reverse the settings for loading certain drivers and avoid issues when starting the PBA on certain systems:

Кеу	Function (with default settings)
k	Keyboard drivers are not loaded
1	There are no keyboard layouts available in the PBA other than the default firmware layout
S	No smartcard support
а	All the above functions are selected
b	Switching between keyboard drivers and layouts (b->both)
с	Switching between the keyboard and/or combined drivers (c->combi)

After that, the current status is briefly displayed before loading the PBA (see example in figure below).

DriveLock Pre-Boot Authentication

Toggle Keyboard Drivers Result: SmartCard Drivers: Y Keyboard Drivers: N Keyboard Layouts: Y Note: The combined driver combines both PS/2 keyboard and PS/2 mouse in one driver to avoid incorrect communication between the drivers.

The following function keys can be used within the start screen:

Кеу	Function
F1	Login with password
F2	Login with token
F3	Emergency logon
F5	Help call
F8	Forced check for tokens

3 DriveLock BitLocker To Go

DriveLock BitLocker To Go includes the following features:

- Enforced encryption of external USB storage media with BitLocker To Go
- Enforced encryption of external drives (e.g. eSATA hard drives)
- DriveLock detects USB drives already encrypted with BitLocker To Go and does not reencrypt them during enforced encryption
- User-defined passwords
- A corporate password can be assigned ensuring that data can only be accessed internally within a company
- Recovery of encrypted data
- Centralized management

3.1 Requirements for BitLocker To Go

Before you can use BitLocker To Go to encrypt external USB storage devices or drives, two conditions must be met:

- 1. You have a valid license for the product. For licensing, proceed as described in the chapter Licensing BitLocker Management.
- 2. You select BitLocker To Go as the encryption method in the general encryption settings.

Proceed as illustrated in the figure.

Under Available encryption methods for removable drives, select the Encryption of removable drives (BitLocker To Go) option.

	.305	-	LINCI CO.	c nere		Line to	ACTIVITY

				OK Cancel	1	Apply	

3.2 BitLocker To Go policy configuration

Before DriveLock can encrypt an unencrypted USB storage device with BitLocker To Go, you need to configure a policy with the appropriate BitLocker To Go settings.

Specify the following:

- 1. General Settings
- 2. Setting: Encrypted drive recovery
 - Encryption recovery rule (certificate-based recovery)
 - Administrative password rule
- 3. Setting: Enforce encryption

A sample configuration explains all necessary steps.

Once you have completed, saved, and assigned the configuration to the DriveLock agents, a new **DriveLock BitLocker To Go** entry appears on the user's Start menu with submenus for restoring, encrypting, connecting, and changing the password of each USB storage device.

The next time a user connects a USB storage device to the DriveLock Agent, an unencrypted drive is immediately encrypted. DriveLock walks users through the encryption process. USB storage devices that have been encrypted before will be recognized in the corporate net-work, won't be re-encrypted and can be used immediately.

Note: Please note that all passwords (user or administrator) should follow the complexity rules (8 characters, upper case, lower case, number, special characters - e.g. DriveLock1\$)

3.2.1 General settings for BitLocker To Go

You can specify the following policy settings to configure how BitLocker To Go is used on DriveLock Agents:

- 1. User interface settings in the Global configuration node:
 - By specifying the **Taskbar notification area settings**, you can configure different types of user notifications. You can move the BitLocker To Go entry to any location here.
- 2. BitLocker To Go settings in the BitLocker Management node:

- Minimum required password complexity for encrypted folders: Specify how complex the passwords must be. If you select Use password policy, make sure to define exact requirements.
- Password complexity policy:

Specify the minimum requirements that users must meet when entering a BitLocker To Go password.

 Settings in the Encryption user experience section: All settings affect the display of BitLocker To Go in the Start menu, taskbar or Windows Explorer.
 For more information, visit BitLocker To Go on the DriveLock Agent.

3.2.2 Recovering encrypted drives

To start with, you select the main certificate (or create a new one) that is essential for the recovery process. Then, you assign an administrative password that will be used to encrypt the USB storage devices.

3.2.2.1 Administrative password

Use a central administrative password for accessing encrypted removable storage devices.

Mote: Ensure that the administrative password is complex enough.

In addition to the central password, you can also create additional administrative password rules and prioritize them differently. By using different passwords, you can provide increased security.

To create a new administrative password rule, select **Encrypted drive recovery**, open the context menu, click New and then **Administrative password rule**.

You can also restrict the password rules for specific **users** or user groups, **computers** or **networks**. Enter the required information on the tabs in the dialog. See the Use cases for more information.

📑 BitLocker To Go - Centrally stored DriveLock policy	Priority Description	Comment
> 🖑 Global configuration	Representative password	
> 🔆 EDR	Lowest Certificate-based recovery	
> 🛞 Drives		
> 📴 Devices	21 User 1	
> 🔶 Network profiles	1 Properties ?	2 ×
> Applications		
✓ 员 Encryption	General Options Computers Networks Users	
Settings	Description	
> Image: DriveLock Encryption 2-Go	User 1

✓ S A BitLocker Management		
Hard disk encryption	Confirmation	
V 🖞 BitLocker To Go		
R Encrypted drive recovery	Strength V	Veak
Enforce encryption	2 Do not automatically use this password when a user mounts and	moted

3.2.2.2 Certificate-based recovery

Before creating an encrypted USB storage device, select a master certificate consisting of a public and private key pair. See chapter Encryption certificates for more information.

You can either create a new certificate or use an existing one. See chapter Create encryption certificates for more information.

You can create several Encryption recovery rules with various certificates, which can be restricted and prioritized differently depending on the information you enter on the Computers, Users, Networks tabs. This is useful if you want to allow different users to restore encrypted data.

Mote: Use the standard recovery certificate (lowest priority) as a minimum.

No other information is required in this dialog.

3.2.3 Settings for enforced encryption

First, please create a default enforced encryption rule. If required, you can create additional rules for specific users, groups, computers or networks later. See the Use cases for more information.

When you create the first rule, you will find a description already entered on the **General** tab. Add a comment and your own text, which is displayed in the user selection dialog.

On the Settings tab you can use the default settings or select the following options:

• Use administrative password. Don't prompt user: If you enable this option, the storage device will be encrypted with the administrative password only. Users are not

prompted to enter their own password during encryption.

- **Prompt user for encryption password**: This setting prompts the user for their own password.
- Attempt to mount using administrative password first: Initially, the user is not asked for their own password. The user will only be prompted for their own password if DriveLock cannot load the storage device automatically, for example, when the administrative password does not match.

Note: Note that this option only works if you have specified an administrative password in the Encrypted drive recovery section.

- Encryption: Select the appropriate encryption method. Please note the following:
 - The default option is AES (256 bit key length).
 - Select **AES (128 bit key length)** if compatibility with older systems is critical for you.
 - **AES-XTS (128 or 256 bit key length)** encryption methods are only available for Windows 10 1511 and higher. Drives encrypted with XTS AES cannot be accessed on older versions of Windows.

3.3 Sample configuration for BitLocker To Go encryption

To encrypt or unlock removable storage devices (USB storage devices) with BitLocker To Go, follow these instructions in the order given.

Mote: For more information on the individual steps, see the cross-references.

1. Create a policy (or open an existing one) that contains the settings related to BitLocker To Go.

Note: Verify that you have licensed BitLocker Management in this policy and that the option is selected in the Licensed Computers section.

2. Go to the **Encryption** node in the policy and click the **Settings** sub-node. At first you define the encryption method.

Note: If you do not select anything here, Encryption 2 Go is the default encryption method.

- 3. Select Available encryption methods.
- 4. In the dialog box, select **Set to value** and check the **Drive encryption on removable data drives (BitLocker To Go)** option. Save your settings and close the dialog.
- 5. Open the **Drives** node. Keep the default value **Not configured (locked)** in the **Removable drive locking** settings for **USB bus connected drives**.
- 6. Open the context menu from the **Drive whitelist rules** sub-node, see the figure below. Select **Drive rule...**.

✓ 💽 Drives			
() Settings			
😟 Removabl	e drive locking		
> 🖞 Drive whit	elist New	> Drive rule	
> 💎 File filter t			•
📇 Drive colle	ectic View	> Drive collect	tion rule

> ③ Applications	B		
> B Encryption	Properties	Encrypted m	nedia rule
> 1 Authenticatio	n Help	Base rule	
> 🛱 Security aware	eness	Terminal ser	vices rule
> 🦻 Systems mana	agement	Rule from te	mplate
> 🖾 Management	console	E-Id	•

- 7. Create a drive rule for the corresponding USB drive. To see how this works, click here.
- 8. Next, open the **Encryption** node again and then the **BitLocker Management**subnode. Here you go directly to **BitLocker To Go** and select the **Encrypted drive recovery** option.
- 9. Here we have already created two standard rules that cannot be deleted.
 - First, open the **Administrative password** rule. Specify a complex administrative password.
 - Second, open the rule for **certificate-based recovery**. You will need to specify a certificate, as this is required for recovery. Either create a new certificate or select an existing one. Save your settings and close the dialog.
- 10. Next, open the context menu of the **Enforce encryption** option, click **New**, and then click **Enforced encryption rule**.

In the following dialog, enter a description on the **General** tab (the first rule already has the description **Default settings for enforced encryption** in this text field). On the **Settings tab**, accept the default settings: **Prompt user for encryption password** and select the option **Attempt to mount using administrative password**. This setting ensures that DriveLock can access the administrative password in the background.

11. Last, assign your policy to all or to specific DriveLock Agents.

3.3.1 Create drive whitelist rule

Please do the following:

1. On the **General** tab, select the USB drive from the list of **Installed drives**. In the figure below, this is the USB drive **E:** with the vendor ID **VendorCo**.

22-BL-2Go - Centrally stored Drive	Vendor ID / Rule type Product ID / Condit Serial number Status Rule type Comment Uniq	ue identifier
> @ Global configuration		text h
> 🔆 EDR		-
✓ (Drives	Ked with ex Drive collectio 2/16	ee9e-5b34
Settings	Liocked Encryption Automatically generated rule - En 0000	0000-C0D

Enforce encryption	OK Cancel Apply	
DriveLock Disk Protection		
> 🖳 BitLocker Management		
> ① Authentication	Refresh	
> 🛱 Security awareness		
> 🦻 Systems management	ок	Cancel
> Management console		

- 2. On the **Permissions** tab, specify that you want to allow this USB drive. For more information on creating whitelist rules, please refer to the administration guide at DriveLock Online Help.
- 3. The **Encryption** tab has nothing selected by default.
 - Check the **Require drive to be encrypted** option. This ensures that the connected and allowed USB drive must be encrypted before it can be used.

New drive exce	ption P	roperties			?	×
Logged on us	sers	Drive letters	Awa	reness	М	essages
General Perm	issions	Filter / Shadov	Time limi	Time limits Compu		Networks
Encryption		Options	Drive sca	in	Con	nmands
General Permissions Filter / Shadow Time limits Computers Networks						
		OK		Cancel		Apply

Note: With this option, the access rights may be modified to enable the intended behavior.

- Second, check the **Automatically encrypt unencrypted media** option to start encryption as soon as a user inserts an unencrypted USB drive and to open a wizard on the DriveLock Agent to guide the user through the encryption process.
- Encrypt on first write attempt: Unencrypted drives may be read, but the drive must be encrypted before writing.

Save your settings and close the dialog.

3.4 BitLocker To Go recovery

DriveLock BitLocker To Go provides a recovery procedure which helps users, who forgot or lost their password, to access their encrypted USB storage device.

The password may be reset even if the client computer is currently not on the corporate network. This challenge-response procedure is very similar to the one used for temporary offline unlocking of locked drives or devices. DriveLock guides users through the recovery process. Administrators can easily generate the requested response code in the DriveLock Management Console.

3.4.1 Recovery procedure

Please do the following:

- 1. Open the **Operating** node in the DriveLock Management Console and select **Agent remote control**.
- 2. Select **BitLocker Management recovery** from the context menu and then select **Recovery of encrypted removable media...**.

✓ [™] _□ Operating			
🚡 Agent re 👌 Network	Connect		
🕰 Shadow	Temporary unlock	>	
	Encryption recovery	>	
	BitLocker Management recovery	>	Disk recovery / emergency logon
	DriveLock Disk Protection recovery and tools	>	Recovery of encrypted removable media
	Additional helpdesk tools	>	

- 3. In the meantime, the user at the client computer has launched the Recovery Wizard and viewed the **request code**. Ask the user to pass it on to you.
- 4. Enter the **request code** in the **Encrypted volume offline recovery** dialog, use copy&paste if you wish. The request code is needed to find the information stored on the DES for the encrypted USB storage device. The text field below shows when and by which user the USB storage device was last encrypted.
- 5. In the next dialog you will see the generated **response code**. Pass it on to the user.
- 6. Next, the user enters the **response code** on the client computer. In the following dialog the user will specify a new user password for the USB storage device.

3.4.2 Recovery in the DriveLock Operations Center (DOC)

You can also restore encrypted USB storage devices with request and response codes from the DriveLock Operations Center (DOC).

Please do the following:

- 1. Open the **DOC** (from the DriveLock Control Center or from a browser).
- 2. Select the **Tasks** section and choose **BitLocker To Go recovery**.

3. By now, the user on the client computer has launched the Recovery Wizard and retrieved the **request code**.

Ask the user to pass it on to you.

4. Enter the **request code** in your DOC screen.

🔳 🔀 Drive	eLock	Administrator@root (Administrator) Administrator Administrator	🌐 en

- 5. Select the appropriate certificate and the matching password.
- 6. Click Generate response code and share it with the user.
- 7. Next, the user enters the **response code** on the client computer. In the following dialog the user will specify a new user password for the USB storage device.

3.5 DriveLock Agent

3.5.1 BitLocker To Go on the DriveLock Agent

When the user plugs in an external USB storage device or external drive to the DriveLock Agent, the following options are available, depending on the policy settings:

1. Unlocking an encrypted drive

To unlock a drive encrypted with BitLocker To Go, a password entry dialog appears immediately. This allows quick unlocking and access to the existing data.

2. Various options in the context menu in Windows Explorer:

• Mount...

If you want to mount a drive encrypted with BitLocker To Go, clicking this menu item will open a wizard where you can select the appropriate drive letter and enter the password. This option can also be configured so that the password is set as the administrator password and then entered automatically.

• Change password...

To change the password of an encrypted drive, click this menu item. Again, a wizard will open where you can first enter your old password and then your new password.

Recover...

Use this menu command to restore the password. The recovery process of an encrypted drive takes place between the administrator and the user. For more information, please visit here.

Unmount

Use this menu command to unmount the drive, even without having administrator rights.

2	USB Drive (H:)					
	Open					
	Open in new window

	Change BitLocker password					
	Manage BitLocker					
	Open AutoPlay					
	🕀 Scan with Windows Defender					
	Give access to >					
	🔓 Unmount					
	🔓 Change password					

3. If specified, the different options for BitLocker To Go can also be selected from the taskbar, see the figure below:

3.6 Use cases

Please see the use cases for the following DriveLock BitLocker To Go options:

- Administrative password
- Enforced encryption

3.6.1 Administrative password rules

- a. You do not assign an administrative password and allow users to assign a password themselves:
 - During initial encryption, each user may choose their own password for encryption. An encrypted drive can only be automatically decrypted if you allow the user to save the password. On any other computer it must be entered when connecting.
- b. You assign an administrative password and allow users to assign a password themselves:
 - During initial encryption, each user may choose their own password for encryption.
 - The administrative password can be used to automatically decrypt data on corporate computers where the DriveLock Agent is running. The user does not have to enter a password.

c. You assign an administrative password and choose encryption with administrative password:

- Users cannot assign their own password during initial encryption.
- The removable storage device can only be decrypted on corporate computers where the DriveLock Agent is running
- When connecting the encrypted removable storage device, the user does not need to enter a password
- Outside the company or on company computers without the DriveLock Agent, the data cannot be decrypted
- d. You create multiple administrator password rules, setting filters for users and/or computers and choosing encryption with administrative password:
 - Users cannot assign their own password during initial encryption.
 - The removable storage device can only be decrypted on corporate computers where the DriveLock Agent is running
 - When connecting the encrypted removable storage device, the user does not need to enter a password

- Outside the company or on company computers without the DriveLock Agent, the data cannot be decrypted
- Access is restricted to specific users or to specific computers (e.g. a department or a team):

You create an administrative password rule that is restricted to user group A. User A1 encrypts a USB stick (forced encryption with administrative password) with administrative password.

Result:

The USB stick can only be decrypted if a user from user group A is logged on to a company computer.

Examples:

- USB sticks encrypted in the Human Resources department can only be decrypted by the users of the Human Resources department
- USB sticks encrypted in the Research department can only be decrypted on computers in the Research department

Warning: Note the priority and the filters set on the Users, Computers and Networks tabs.

3.6.2 Encryption rules

a. For example, you could choose the user group you want your rule to apply to:

- User group A may assign their own password
- User group B may not assign their own password
- b. Or you could choose specific company computers you want your rule to apply to:
 - You do not add an administrative password for USB storage devices that are encrypted on the works council computers.
 - All USB storage devices that were encrypted on the computers in the development department may only be decrypted within the company.
